# “Informal” mathematics

Math as raw data (text, images, ...)

- Flexible
- Useful (e.g., in education)
- No correctness guarantees

Input:

Let  $r$  be a root of  $x^2 + 5x + 7 = 0$ . Compute  $(r - 1)(r + 2)(r + 6)(r + 3)$ .

LEMMA 34B solution:

We have

$$\begin{aligned}(r - 1)(r + 2)(r + 6)(r + 3) &= (r^2 + r - 2)(r^2 + 9r + 18) \\&= r^4 + 10r^3 + 25r^2 + 19r - 36 \\&= r^4 + 5r^3 + 7r^2 + 5r + 7 + 5r^3 + 20r^2 + 14r - 36 \\&= r^4 + 5r^3 + 25r^2 + 19r - 29 \\&= (r^2 + 5r + 7)(r^2 + 4r - 5) \\&= (0)(r^2 + 4r - 5) \\&= \boxed{0}.\end{aligned}$$

Final Answer: The final answer is 0.

Figure 1: Language model solution.

# Formal mathematics

## Math as source code

- Write a specification (e.g.,  $1+1=2$ )
- Write a proof
- Automatically checked
  - Code compiles  $\equiv$  correct proof

$$1 + 1 = 2$$

proof ✓

```
lemma one_plus_one_equals_two:
  shows "1 + 1 = 2"
proof -
  have "1 + 1 = Suc (0 + 1)" by simp
  also have "... = Suc 1" by simp
  also have "... = 2" by simp
  finally show ?thesis by simp
qed
```

Figure 2: Math as source code.

# Formal mathematics

Math as **source code**

- Write a specification (e.g.,  $1+1=2$ )
- Write a proof
- **Automatically checked**
  - Code compiles  $\equiv$  correct proof

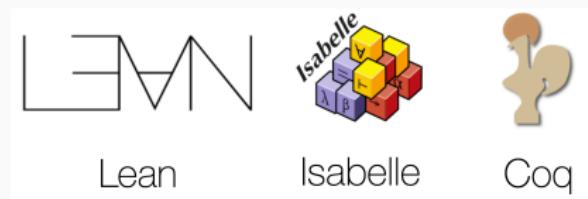

Figure 3: Theorem proving languages

# Formal mathematics (Demo)

If  $R \subseteq S$  and  $S \subseteq T$  then  $R \subseteq T$

THEOREM PROVER

# How is formal math used in practice?

Growing use in mathematics:

Terence Tao  
@tao@mathstodon.xyz

Finished formalizing in #Lean4 the proof of an actual new theorem  
(Theorem 1.3) in my recent paper [arxiv.org/abs/2310.05328](https://arxiv.org/abs/2310.05328) :

<sup>1</sup>E.g., [Polu & Sutskever 2020], [Han et al 2021], [Jiang et al 2022], [Yang et al 2023]

# Language models

- Model:  $p_\theta(\mathbf{y}|\mathbf{x}; \mathcal{D})$ 
  - $\mathbf{y}$  : output sequence
  - $\mathbf{x}$  : input sequence
  - $\theta$  : parameters (e.g., transformer)
  - $\mathcal{D}$  : dataset

# Language models

- Model:  $p_\theta(y|x; \mathcal{D})$ 
  - $y$ : output sequence
  - $x$ : input sequence
  - $\theta$ : parameters (e.g., transformer)
  - $\mathcal{D}$ : dataset
- Learning:
  - $\arg \max_\theta \sum_{y \in \mathcal{D}} \log p_\theta(y)$

# Language models

- Model:  $p_\theta(y|x; \mathcal{D})$ 
  - $y$ : output sequence
  - $x$ : input sequence
  - $\theta$ : parameters (e.g., transformer)
  - $\mathcal{D}$ : dataset
- Learning:
  - $\arg \max_\theta \sum_{y \in \mathcal{D}} \log p_\theta(y)$

# Language models

- Model:  $p_\theta(y|x; \mathcal{D})$ 
  - $y$ : output sequence
  - $x$ : input sequence
  - $\theta$ : parameters (e.g., transformer)
  - $\mathcal{D}$ : dataset
- Learning:
  - $\arg \max_\theta \sum_{y \in \mathcal{D}} \log p_\theta(y)$
- Inference:
  - $y = f(p_\theta(\cdot|x))$
  - $f$ : e.g., sampling

# Problem setup

Proof: sequence of (state, step)

- $(x_0, y_0), \dots, (x_T, y_T)$
- $x_t$ : proof state from Lean
- $y_t$ : proof step (“tactic”)

The diagram illustrates the sequence of proof states and steps. A curved arrow points from  $x_t$  to  $y_t$ . The Lean theorem prover interface shows two tactic states. The top state is labeled "Tactic state" and "1 goal". It shows the goal  $R \subseteq S \rightarrow S \subseteq T \rightarrow R \subseteq T := \text{by}$ . The bottom state shows the goal  $\text{intro } h_1 \ h_2 |$ .

# Problem setup

Proof: sequence of (state, step)

- $(x_0, y_0), \dots, (x_T, y_T)$
- $x_t$ : proof state from Lean
- $y_t$ : proof step (“tactic”)

The image shows a screenshot of the Lean theorem prover interface. At the top, it says "Tactic state" with "1 goal". Below that, there are three hypotheses:  $\alpha : \text{Type}$ ,  $R S T : \text{Set } \alpha$ ,  $h_1 : R \subseteq S$ ,  $h_2 : S \subseteq T$ , and  $\vdash R \subseteq T$ . In the center, there is a code editor window with the following content:

```
example : R ⊆ S → S ⊆ T → R ⊆ T := by
| intro h₁ h₂
| exact h₁.trans h₂
```

Below the code editor, it says "No goals" and shows a small icon of a party hat.

# Problem setup

Proof: sequence of (state, step)

- $(x_0, y_0), \dots, (x_T, y_T)$
- $x_t$ : proof state from Lean
- $y_t$ : proof step (“tactic”)

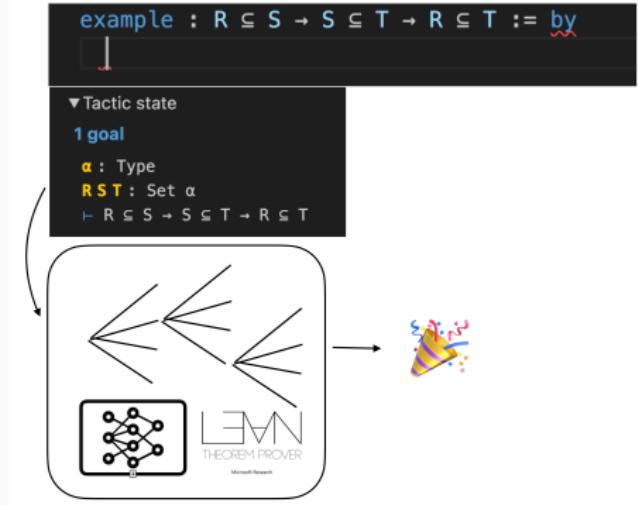

The image shows a screenshot of the Lean theorem prover interface. On the left, there is a small icon of a neural network. A curved arrow points from this icon to the top-left section of the interface, which displays the 'Tactic state' and '1 goal'. The tactic state includes declarations for  $\alpha : \text{Type}$ ,  $R S T : \text{Set } \alpha$ ,  $h_1 : R \subseteq S$ ,  $h_2 : S \subseteq T$ , and  $\vdash R \subseteq T$ . Below this, a code editor shows the tactic code: `example : R ⊆ S → S ⊆ T → R ⊆ T := by intro h1 h2 exact h1.trans h2`. To the right of the code editor is the Lean logo and the text 'THEOREM PROVER' and 'Microsoft Research'. At the bottom of the interface, it says 'No goals' next to a small party hat icon.

Idea: train language model  $p_\theta(y_t|x_t)$  on a dataset of (state, step) pairs

# Problem setup

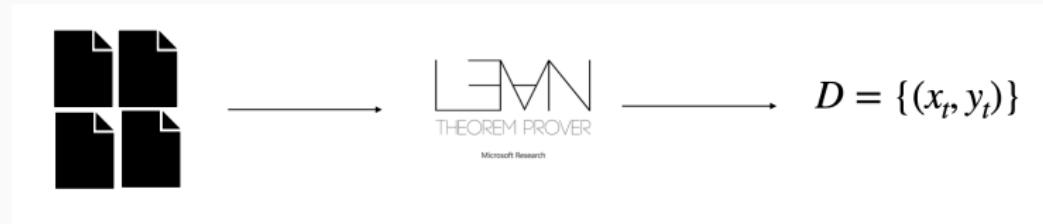

Proof: sequence of (state, step)

- $(x_0, y_0), \dots, (x_T, y_T)$
- $x_t$ : proof state from Lean
- $y_t$ : proof step (“tactic”)

...then use the model + tree search to prove full theorems

# 1. Data

- Extract (state, tactic) pairs from Lean projects. Tools:
  - **ntp-training-data** (this tutorial)<sup>5</sup>
  - Lean Dojo [2]

<sup>5</sup>Based on [github.com/semorrison/lean-training-data](https://github.com/semorrison/lean-training-data)

# 1. Data (ntp-training-data)

- Format each (state, tactic) pair as (prompt, completion) example:

```
_ You are proving a theorem in Lean 4.  
You are given the following information:  
- The current proof state, inside [STATE]...[/STATE]  
  
Your task is to generate the next tactic in the proof.  
Put the next tactic inside [TAC]...[/TAC]  
-/  
[STATE]  
m n :  $\mathbb{N}$   
h : Nat.Coprime m n  
 $\vdash$  Nat.gcd m n = 1  
[/STATE]  
Prompt: [TAC]
```

```
rw [Nat.Coprime] at h  
Completion: [/TAC]
```

Mathlib gives a dataset of  $\approx 300,000$  examples

# 1. Data (ntp-training-data)

The screenshot shows the Hugging Face platform interface for a dataset named "ntp-mathlib-instruct-st".

Figure 8: Data on Huggingface

[NOTEBOOK DEMO]

## 2. Learning

---

- Standard supervised learning on  $\mathcal{D}$ :

$$\arg \max_{\theta} \sum_{(x_t, y_t) \in \mathcal{D}} \log p_{\theta}(y_t | x_t)$$

# Learning (ntp-tune)

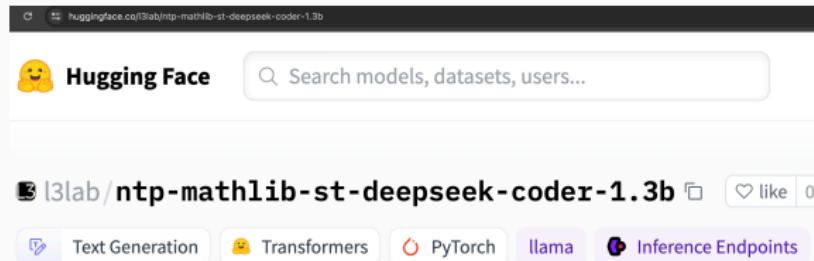

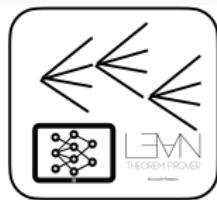

Figure 9: Trained tutorial model on Huggingface

[NOTEBOOK DEMO]

### 3. Proof search

- Use generator  $p_\theta(y_t|x_t)$  to generate a full proof  $y_1, \dots, y_T$
- Standard approach: *Best-first search*

### 3. Proof search | Best-first search

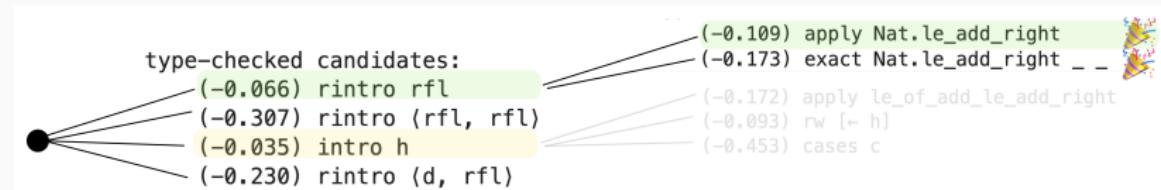

Figure 10: Best-first search<sup>6</sup>

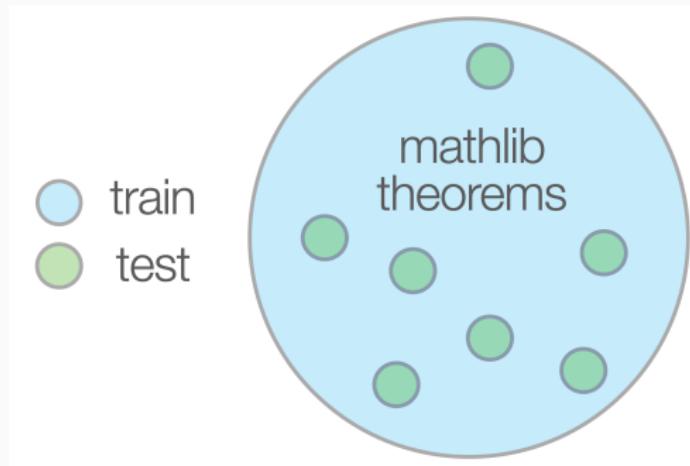

<sup>6</sup>Example scoring function  $\frac{1}{Z} \sum_t \log p_\theta(y_t | x_t)$

### 3. Proof search | Best-first search

[NOTEBOOK DEMO]

## 4. Evaluation

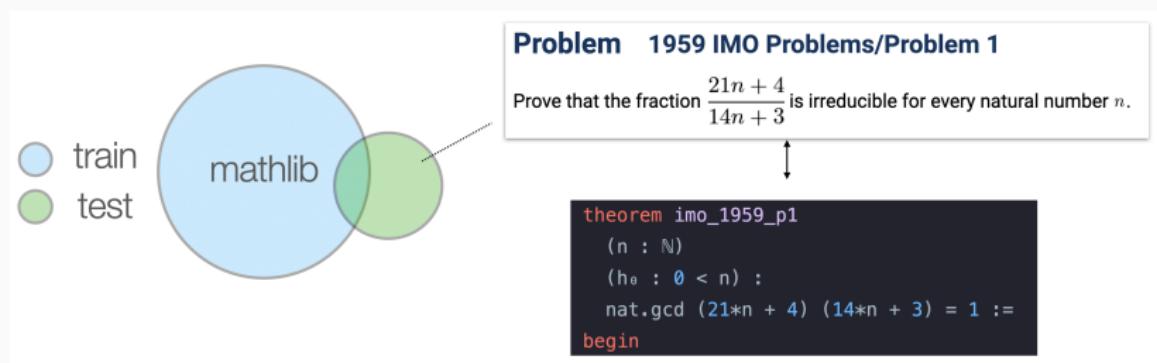

- Proof search on held-out theorems from the training distribution

## 4. Evaluation | benchmarks

Benchmarks evaluate problems drawn from a different distribution:

- miniF2F [3]: competition problems (AMC, AIME, IMO)

## 4. Evaluation

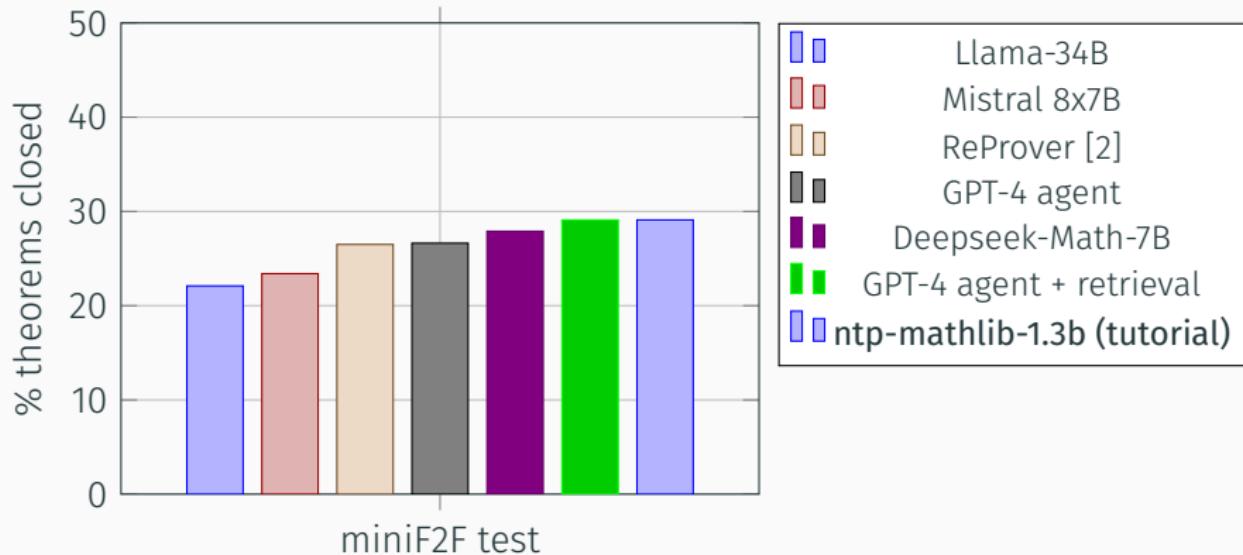

Figure 11: Proof search performance on miniF2F theorems. The model we trained in the tutorial notebooks gets 29.1% (71/244) on miniF2F test.

## 4. Evaluation

```
-- from mathlib:  
theorem prod_mono  
  {s1 s2 : Subsemiring R} (hs : s1 ≤ s2)  
  {t1 t2 : Subsemiring S} (ht : t1 ≤ t2) :  
  s1.prod t1 ≤ s2.prod t2 := by  
  intro x hx  
  simp_rw [Subsemiring.mem_prod]  
  cases' x with x_fst x_snd  
  exact ⟨hs hx.1, ht hx.2⟩  
  
-- from miniF2F:  
theorem mathd_algebra_159 (b : ℝ) (f : ℝ → ℝ)  
  (h0 : ∀ x, f x = 3*x^4 - 7*x^3 + 2*x^2 - b*x + 1)  
  (h1 : f 1 = 1) : b = -2 := by  
  apply eq_neg_of_add_eq_zero_left  
  rw [h0] at h1  
  norm_num at h1  
  linarith
```

Figure 12: Generated proofs

## 4. Evaluation

---

[NOTEBOOK DEMO]

## 5. Extensions: context

Real theorem proving uses context (e.g., new definitions, lemmas) [1]:

```
variable {Ω : Type*} [Fintype Ω]

structure my_object (Ω : Type*) [Fintype Ω] :=
  (f : Ω → ℝ)
  (cool_property : ∀ x : Ω, 0 ≤ f x)

theorem my_object_sum_nonneg (o1 o2 : my_object Ω) : o1.f + o2.f ≥ 0 := by
  apply add_nonneg
  . apply o1.cool_property
  . apply o2.cool_property
```

Figure 13: The theorem uses a newly defined *my\_object* and *cool\_property* [1].

A model trained on (state, tactic) examples does not access context outside of its training set.

## 5. Extensions: context

---

Train a context-dependent model:

$$p_{\theta}(y_t|x_t, c_t), \quad (1)$$

e.g., where  $c$  is the preceding file contents.

## 5. Extensions: context

```
L You are proving a theorem in Lean 4.  
You are given the following information:  
- The file contents up to the current tactic, inside [CTX]...[/CTX]  
- The current proof state, inside [STATE]...[/STATE]  
  
Your task is to generate the next tactic in the proof.  
Put the next tactic inside [TAC]...[/TAC]  
-/  
[CTX]  
import Mathlib.Data.Nat.Prime  
  
theorem test_thm (m n : Nat) (h : m.Coprime n) : m.gcd n = 1 := by  
  
[/CTX]  
[STATE]  
m n : N  
h : Nat.Coprime m n  
⊢ Nat.gcd m n = 1  
[/STATE]  
[TAC]
```

Prompt:

Completion:

```
rw [Nat.Coprime] at h  
[/TAC]
```

- DT-Solver [Wang et al 2023]

## Retrieval

- Reprover [Yang et al 2023]

## Integrating symbolic provers

- Thor [Jiang et al 2022]

## LLM agents

- COPRA [Thakur et al 2024]

## Benchmarks

- MINIF2F [Zheng et al 2021]
- PROOFNET [Azerbayev et al 2023]

## Data extraction/interaction

- PISA [Jiang et al 2021] (Isabelle)
- PACT [Han et al 2021] (Lean 3)
- LEAN-TRAINING-DATA [Morrison 2023]
- NTP-TRAINING-DATA (this tutorial)
- Lean Dojo [Yang et al 2023]

## Tools

- LLMLEAN/LLMSTEP [Welleck & Saha 2023]
- Lean Copilot [Song et al 2023]

*Non-exhaustive list; also more extensions in the next section!*

1. Intro: LLMs  $\cap$  mathematics
  - Informal and formal mathematics
  - Why is formal mathematics important?
2. Part I: Build a LLM formal theorem proving tool
  - Data, training, proof search, evaluation, tool
3. **Part II: Leveraging *informal* mathematical data**
  - Via foundation model
  - Via translation and guidance

## PART II: Leveraging *informal* mathematical data

---

## Leveraging *informal* mathematical data

- *Previous:* train a model purely on formal data

# Leveraging *informal* mathematical data

- Previous: train a model purely on formal data
- Next: use *informal* mathematical data
  - Latex proofs
  - Math textbooks, papers, websites, ...
  - Conversations, ...

Why leverage informal data?

1. Data scarcity

- Lean: 300 million tokens
- Arxiv: 29 billion tokens
- General web data: > 5 trillion tokens

Why leverage informal data?

1. Data scarcity

- Lean: 300 million tokens
- Arxiv: 29 billion tokens
- General web data: > 5 trillion tokens

2. Guiding search

- Informal proofs can help cut down the space of possible proofs

# Leveraging *informal* mathematical data

---

Why leverage informal data?

## 1. Data scarcity

- Lean: 300 million tokens
- Arxiv: 29 billion tokens
- General web data: > 5 trillion tokens

→ *transfer knowledge by adapting a generalist model to mathematical data*

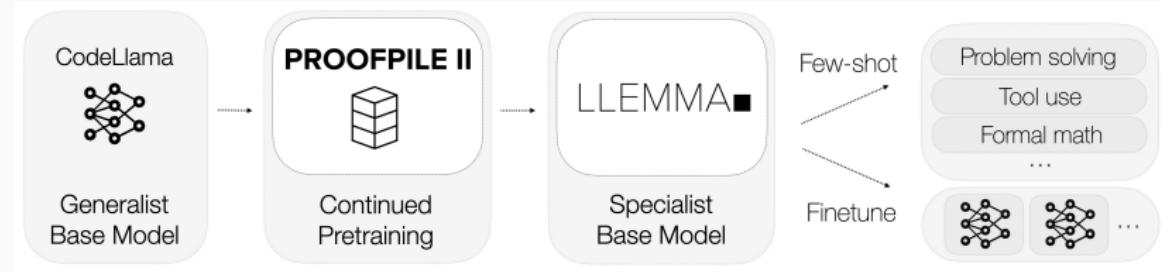

## 2. Guiding search

- Informal proofs can help cut down the space of possible proofs

# Foundation model for mathematics : LLEMMA<sup>8</sup>

Recipe for adapting a language model to mathematical data:

- Collect high-quality, diverse math-related corpus, PROOFILE II
- Continue pretraining a base model (e.g., Code Llama) on PROOFILE II

<sup>8</sup>Llemma: an open language model for mathematics

Zhangir Azerbayev, Hailey Schoelkopf, Keiran Paster, Marco Dos Santos, Stephen Marcus McAleer, Albert Q. Jiang, Jia Deng, Stella Biderman, Sean Welleck

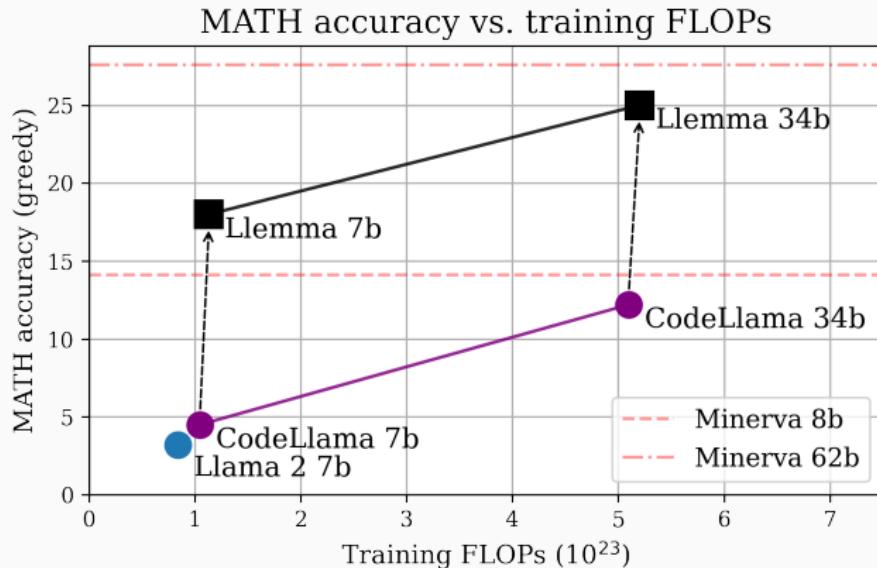

Figure 16: LLEMMA improves with a modest amount of math-specific compute

Proofpile II : code + web data + Arxiv papers

- ALGEBRAICSTACK – 11B tokens from 17 programming languages
  - 1.5B tokens of formal math
  - Extracted Lean and Isabelle goal states

The image shows a screenshot of a Lean code editor interface. On the left, there is a code editor window containing the following Lean code:

```
example : R ⊆ S → S ⊆ T → R ⊆ T := by
| intro h1 h2|
```

On the right, there is a panel titled "▼Tactic state" displaying the current goal and its hypotheses:

- 1 goal**
- $\alpha : \text{Type}$
- $R S T : \text{Set } \alpha$
- $h_1 : R \subseteq S$
- $h_2 : S \subseteq T$
- $\vdash R \subseteq T$

Figure 17: Lean code (left) and goal state (right)

- 14.7 billion tokens of math-related web data

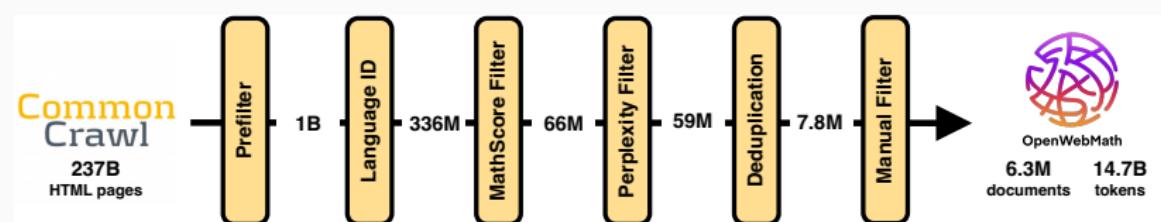

Figure 18: OpenWebMath pipeline.

<sup>9</sup>*OpenWebMath: An Open Dataset of High-Quality Mathematical Web Text.*  
Keiran Paster, Marco Dos Santos, Zhangir Azerbayev, Jimmy Ba

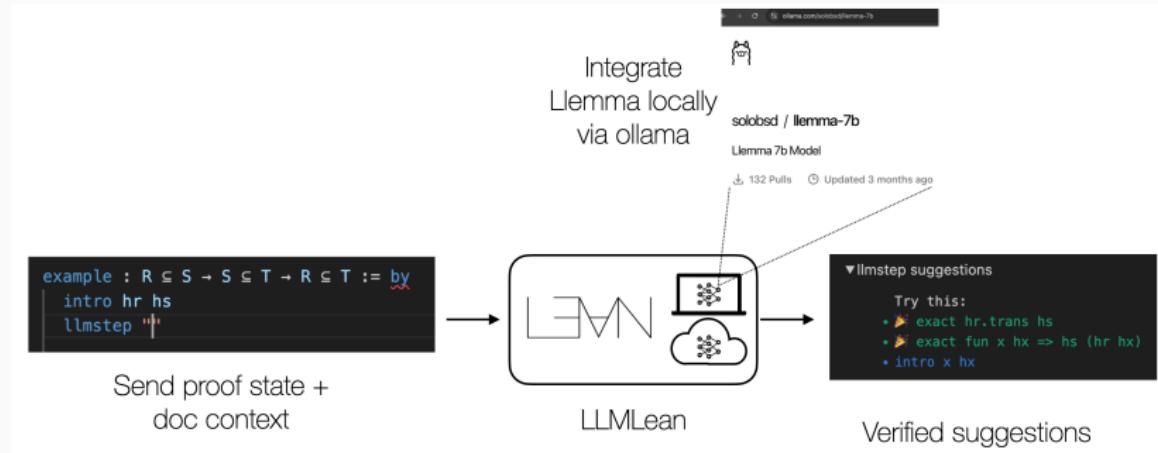

Traditional proof search:  $p_\theta(\text{next-tactic}|\text{state}) + \text{best-first search.}$

- We implement a *few-shot* version by providing LLEMMA with 3 (*state, next-tactic*) examples in its prompt

Figure 19: Few-shot proving in Lean with LLEMMA

# LLEMMA on your laptop with LLMLEAN<sup>10</sup>

DEMO

<sup>10</sup><https://github.com/cmu-l3/llmlean>, based on *LLM proofstep suggestions in Lean*.  
Sean Welleck & Rahul Saha, Neurips Math+AI 2023

- Leverage informal data by pretraining + adaptation to diverse mathematical data
  - LLEMMA: 7B and 34B CodeLLama further trained on PROOFPILE II
- Open platform for research:
  - Code/Models/Data: <https://github.com/EleutherAI/math-lm>

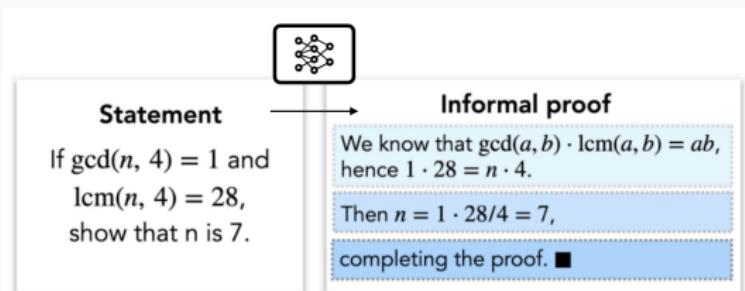

Why leverage informal data?

1. Data scarcity
2. Guiding search
  - Informal proofs can help cut down the space of possible proofs

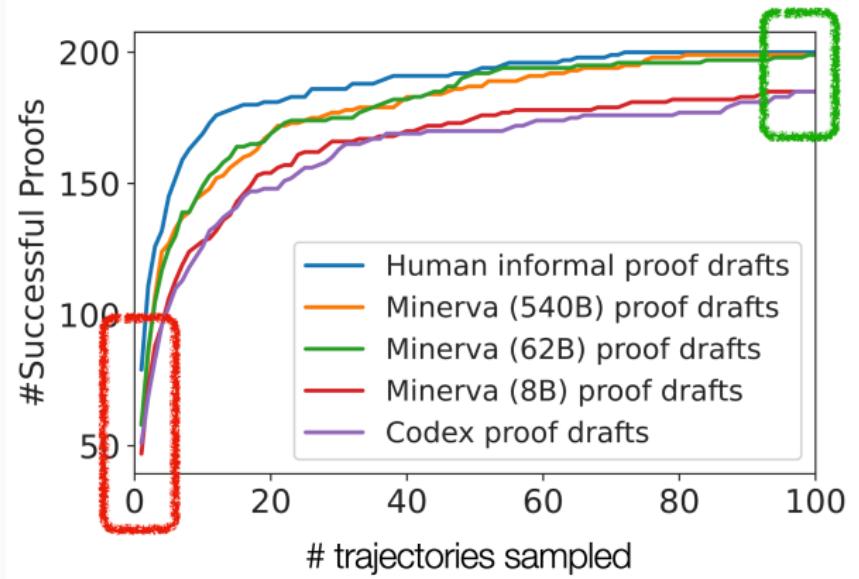

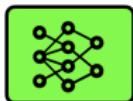

Figure 22: Proof search scaling

# Draft-sketch-prove

**Statement:** Prove that the fraction  $\frac{21n+4}{14n+3}$  is irreducible for every natural number  $n$ .

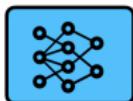

### Informal Proof (Minerva 62B):

We must show that  $\gcd(21n + 4, 14n + 3) = 1$ .

The Euclidean algorithm gives

$$\begin{aligned}21n + 4 &= 1 \cdot (14n + 3) + 7n + 1 \\14n + 3 &= 2 \cdot (7n + 1) + 1.\end{aligned}$$

Since  $\gcd(7n + 1, 1) = 1$ , we have  $\gcd(21n + 4, 14n + 3) = 1$ .

### Formal Proof:

```
theorem imo_1959_p1:
  fixes n :: nat
  shows "gcd (21*n + 4) (14*n + 3) = 1"
proof -
  (* The Euclidean algorithm gives
  21n+4=1\cdot(14n+3)+7n+1
  14n+3=2\cdot(7n+1)+1. *)
  have c0: "21*n + 4 = 1*(14*n + 3) + 7*n + 1"
    by auto [ATP]
  have cl: "14*n + 3 = 2*(7*n + 1) + 1" using c0
    by auto [ATP]

  (* Since \gcd(7n+1,1)=1, we have \gcd(21n+4,14n+3)=1. *)
  then have "gcd (7*n + 1) 1 = 1"
    using cl
    by auto [ATP]
  then have "gcd (21*n + 4) (14*n + 3) = 1"
    using cl
    by (smt (z3) BitM_plus_one ab_semigroup_add_class.add_ac(1)
      add.assoc c0 gcd.commute gcd_add2 gcd_add_mult mult_numerals_
      numeral_One numeral_eq_Suc numerals(1) semiring_norm(3)) [ATP]
  then show ?thesis
    using cl
    by blast [ATP]
qed
```

# Draft, Sketch, Prove

---

[DEMO NOTEBOOK]

Why leverage informal data?

1. Data scarcity

- Adapt a foundation model to “all” mathematical data

2. Guiding search

- Informal proofs can help cut down the space of possible proofs
